

Bars: the interval on a paired effect under four inference budgets, from the measured task/prompt/sample components.
 Diamonds: the spread of the same effect across three seeds -- no amount of inference in one run reduces it, only more runs do.

◆ between-seed spread (1.96 sigma), one seed ■ as run: 15 tasks x 24 prompts x 8 samples ■ 4x samples per prompt ■ 4x prompts per task ■ 4x tasks

Qwen (OOD persona: comic)
